

Claude Code – Training Manual & SOP
Prepared from: Feb 21, 2026 Intro Session (Greg Kowalczyk)
Audience: Tino, Sarah, Patricia, Mathijs – and anyone joining the team
Purpose: Complete reference guide for understanding and using Claude Code as a business tool

Table of Contents

1. What Is Claude Code?

Claude Code is an **agentic** version of Claude – the AI assistant made by Anthropic. The word "agentic" is the key: it means Claude can take action, not just give advice.

Think of it in three levels:

Level	Tool	What it does
Basic	Claude.ai (web chat)	You ask, it answers. No memory,

no files, no action. |
| ****Intermediate**** | Claude desktop app | Chat with a little more power. Limited file access. |
| ****Advanced**** | Claude Code | Full agent. Reads, writes, manages files. Executes tasks. Connects to external tools. Remembers your business. |

Claude Code runs primarily in a terminal or through a code editor like ****Cursor**** (think of Cursor as the window that Claude Code lives inside). You do not need to know how to code to use it.

2. Claude vs. Claude Code – Key Differences

This is the most important concept to understand before anything else.

Regular Claude (claude.ai)

- ❌ Forgets everything when you close the chat window
- ❌ Cannot access files you've created
- ❌ Can only advise – it tells you what to do, it cannot do it
- ❌ No connection to your real business data (files, Drive, databases)
- ❌ Every task starts from scratch every time
- ✅ Good for: quick questions, drafting text, brainstorming

****Patricia's note:**** "You can tell it 'we referenced this in a previous chat' – but it only remembers within the same chat session. It can't access your documents automatically."

Claude Code (agentic)

- ✅ Reads, writes, and manages files on your computer
- ✅ Executes tasks – it doesn't just advise, it does the work
- ✅ Knows your business deeply once you build a knowledge base
- ✅ Connects to external tools (Google Drive, GitHub, web search, etc.)
- ✅ Saves all work as permanent files
- ✅ Can run multiple agents simultaneously on different tasks
- ✅ Builds on previous sessions – knowledge compounds over time

****The analogy:**** Regular Claude is like calling a consultant who forgets you the moment you hang up. Claude Code is like hiring a full-time employee who knows your business, keeps records, and actually does the work.

3. The Knowledge Base – CLAUDE.md Files

What Is a CLAUDE.md File?

A **CLAUDE.md** file (pronounced "Claude MD") is a plain text file written in **Markdown format**. It is the foundation of Claude Code's memory system.

Markdown = a simple text format that computers can read natively. Unlike PDF, Word documents, or other files, markdown files don't require any third-party software to open. They look like black text files with some formatting marks (# for headers, **bold**, etc.).

Why It Matters

CLAUDE.md files are automatically loaded at the start of every session. This is how Claude Code "remembers" your business without you having to re-explain everything each time.

There are two types:

Type	Scope	Example
Global CLAUDE.md	Applies to all your projects	Who you are, your companies, your general preferences
Project CLAUDE.md	Applies only to one specific project	This project's goals, tech stack, file locations, past decisions

What to Put in a CLAUDE.md File

Global file – business context:

- Company names, products, team members
- Tone of voice and writing style preferences
- File storage locations (Google Drive paths, Dropbox paths)
- Common mistakes to avoid
- Templates and standard formats

Project file – project context:

- Project goals
- Tech stack being used
- Current status and completed tasks
- Key decisions already made
- What NOT to do (lessons learned)

What NOT to Put in CLAUDE.md

Do not overload it with everything. The CLAUDE.md file has memory limits – if it's too long, the agent can't read it efficiently.

****Rule:**** Put only the most essential, always-relevant information in CLAUDE.md.

For specific tasks (like how to write a blog post), use ****Skills**** instead (see Section 6).

Patricia's Example (confirmed correct):

****"When you talk about me, I'm Patricia. These are the people on my team. When you have this situation, follow this instruction."***

That's exactly right. It's an instruction document. You're training the AI on how to work with you specifically.

The Error-Correction Use Case

Greg's actual workflow: when Claude Code makes a recurring mistake – like saving files to the wrong folder – he adds a line to CLAUDE.md:
> "When we have this situation, please follow this instruction. Do not make this mistake."

It learns and stops repeating it.

4. MCPs – External Connectors

What Is an MCP?

****MCP = Model Context Protocol**** (sometimes called Multi-Channel Protocol)

Think of MCPs as ****USB ports for Claude Code****. They are standardized connections that allow Claude to plug into external tools and services.

Without an MCP: Claude is isolated – it can only use what's on your computer.

With an MCP: Claude can connect to any service that has a connector – Google Drive, GitHub, databases, web tools, APIs, and more.

The USB Port Analogy

> "It's like a USB port to a standard. You need a connection from one media to another, and then it finds the compatibility." – Greg

Once the MCP is connected, Claude knows how to read and write data from that service.

What MCPs Can Do

MCP	What It Connects To	What Claude Can Do
Google Drive	Your Drive files	Read documents, write new files, modify existing ones – while you watch it happen live
GitHub	Code repositories	Save, version, and push code automatically
QuickBooks	Accounting data	Read transactions, categorize expenses, generate reports
Google Workspace	Sheets, Docs, Calendar	Read and write spreadsheets, update calendars
Databases	Any SQL/NoSQL database	Query, update, and analyze data
Image generation tools	Glif, Replicate	Create images from prompts

Who Creates MCPs?

1. **Service companies** create them for their own products (e.g., Google creates the Google Drive MCP)
2. **Developers** create custom MCPs for services that don't have one yet
3. **You** can eventually create your own if needed (no-code tools exist for this)

The Tax Example

Patricia asked about taxes. Here's how MCPs apply:

- Connect QuickBooks MCP → Claude reads all your transaction data
- Connect Google Drive MCP → Claude reads your receipt photos
- Run an agent → It categorizes receipts, updates spreadsheets, flags issues
- Watch it happen live on your screen

5. Plugins – The Power Toolbox

What Is a Plugin?

Plugins are either individual tools or **combinations of MCPs and tools** bundled together. They are one level more powerful than a single MCP.

Where MCPs are pure connectors, **plugins add intelligence and capability** to those connections.

Key Plugins Greg Uses

Perplexity

- **What it does:** Real-time web search with cited sources
- **Use case:** Keyword research, competitor research, market data, current news
- **Business example:** "Find me the top 20 keywords for kinesiology tape in Canada with monthly search volume"
- **Why it matters:** Replaces expensive tools like SEMrush or Ahrefs for a fraction of the cost

Playwright

- **What it does:** Automates browser tasks – Claude takes control of a web browser
- **Use cases:**
 - Auto-retrieve bank statements every month
 - Scrape contact information from directories
 - Pull data from sites that require login
 - Fill out forms automatically
- **Business example:** "Go to Scale Insights, log in, pull this month's Amazon PPC data, put it in my spreadsheet"
- **You can watch it work** in real time on your screen

Firecrawl

- **What it does:** Scrapes competitor websites
- **Use cases:** Analyze competitor pricing, copy, product descriptions, page structure
- **Business example:** "Find all auto repair shops in Toruń, Poland. Give me their websites, contact info, and what services they advertise."

Google Workspace

- **What it does:** Reads and writes Google Sheets, Docs, Gmail, Calendar
- **Use case:** Auto-update your inventory spreadsheet, send Gmail outreach, log appointments

Image Generation (Glif / Replicate)

- **What it does:** Creates AI images from text prompts
- **Workflow:** Write blog post → auto-generate matching image → auto-generate social post version
- **Why it matters:** Replaces Canva/design tools for many use cases

Hive Rank (SEO Intelligence Network)

- **What it does:** Tracks keyword rankings, competitor SEO, content gaps
- **Use case:** Know exactly where your blog posts rank, what keywords competitors rank for, opportunities to grab traffic

6. Skills – Reusable Workflows

What Is a Skill?

A **skill** is a custom-built, pre-written set of instructions saved as a markdown file. It is a reusable workflow – a playbook – for a specific task you do repeatedly.

The slash command: Skills are invoked with a ``/`` command. Example:

- ``/newsletter`` – runs the newsletter-writing workflow
- ``/seo-content`` – runs the blog post writing workflow
- ``/orchestrator`` – activates the project planning master agent

The Key Concept

Every time you want Claude to do a specific task the same way, you don't re-explain it. You call the skill, and the skill file contains all the instructions.

Without a skill: "Write me a newsletter. Use our brand voice. Start with a hook. Include 3 tips. End with a CTA. Keep it under 600 words. Format like our previous newsletters..."

With a skill: ``/newsletter kids nasal strips``

The skill already knows all those instructions. You just trigger it.

Pre-Built vs Custom Skills

You do not need to build skills from scratch. There are **40-50+** pre-built skills already available covering:

Category	Examples
Content	Blog posts, newsletters, social media posts, email sequences
SEO	Keyword research, competitor analysis, content briefs
Marketing	Landing pages, positioning, brand voice, lead magnets
Strategy	Competitor gaps, topic research, content calendars
Technical	Website building, PRD creation, code review
Research	Market analysis, trend research, competitor hooks

You can also customize: Take an existing skill and add your own instructions on top of it. Greg's setup has evolved through months of customization.

How to Think About Skills

Without Skills	With Skills
-----	-----

| Explain everything from scratch each time | Call a proven workflow
in one command |
| Inconsistent output quality | Consistent, predictable results |
| 30-60 minutes to set up a task | Seconds to invoke |
| Easy to forget important steps | Every step is encoded in the skill
|

Building Your Own Skill

If you need a workflow that doesn't exist yet:

1. Describe what the workflow should do
2. Ask Claude Code to write the skill file for you
3. Test and refine it
4. Save it – it becomes part of your permanent toolbox

7. The Orchestrator – Your AI Project Manager

What Is the Orchestrator?

The Orchestrator is a master-level skill that acts like a **project manager or CEO**. It:

- Takes your high-level goal
- Asks you clarifying questions to understand the full context
- Breaks the project into sub-tasks
- Assigns each sub-task to the right specialized agent/skill
- Coordinates everything and presents the result

How It Works (Real Example from the Meeting)

Goal: "Build a complete website for an auto mechanic in Toruń, Poland. Optimize for SEO."

What the Orchestrator did:

1. Activated and asked Greg clarifying questions:
 - What is your role in this project?
 - What tech stack do you want to use?
 - What is the primary business goal? (phone calls? walk-ins? online bookings?)
 - What is the current online presence?
2. Greg answered: Astro + Vercel, goal = phone calls and walk-ins, only a Facebook page exists
3. The Orchestrator wrote a complete implementation plan including:
 - Competitor research (who ranks locally, what they do)
 - Keyword strategy (brand+city, service+city combinations)
 - Brand voice and positioning
 - Full website architecture (15 pages)
 - 3-month content calendar
 - SEO and AI discoverability strategy

- Content atomization (blog → 5 social posts + newsletter)
4. Saved the plan as an MD file for review
 5. Greg approved → the build agent executed all 18 tasks automatically

****Total time from idea to complete website:**** One evening.

The Ask User Question Tool

During planning, the Orchestrator uses the ****"Ask User Question" tool**** to interview you before starting. This is not a bug – it's how it builds a much better final product.

Tino's observation from the meeting: ****"If you use this tool and answer 30-50 questions, the final plan is much better."***

****Rule:**** Never skip the questions. The more context you give, the better the output.

The Planning Gate

****Standard workflow for any major task:****

1. Invoke the Orchestrator or enter Plan Mode
2. Answer the questions
3. Review the plan (as an MD file)
4. Approve or modify
5. Execute

The plan is always saved as a file – so you can revisit, modify, and re-execute later.

8. Models – Haiku, Sonnet, and Opus

Claude Code uses different AI models underneath. Each costs differently and has different capabilities.

The Three Models

Model	Cost	Best For
-----	-----	-----
Haiku	Cheapest	Simple, fast tasks. Quick lookups, basic summaries.
Sonnet	Mid-range	Day-to-day work. Most tasks. Best cost-to-performance ratio.
Opus	Most expensive	Complex multi-step reasoning. Complicated plans, nuanced analysis.

The Recommended Strategy

****Use Opus to plan. Use Sonnet to execute.****

1. Let Opus (the smartest model) build the plan – it thinks harder, misses less
2. Switch to Sonnet to execute the steps – cheaper, fast enough, no loss in quality for execution tasks

****Warning:**** Running Opus continuously on a large project will burn through your token credits quickly. Be intentional about when you use it.

Token Economics

You are charged per ****token**** (roughly 4 characters = 1 token). Claude Pro subscription starts at \$20/month. For the amount of work Claude Code can produce, this is extraordinarily cheap compared to consultants and agencies.

9. Platforms – Which Version to Use

Claude.ai (Web Version)

- ****Best for:**** Quick chat questions, document analysis, drafting
- ****Limitations:**** No file management, no MCPs, no skills (without Claude Code Desktop)
- ****Who should use it:**** Anyone, for everyday questions

Claude Desktop App

- ****Best for:**** Getting started with Claude Code
- ****Includes:**** Basic Claude Code functionality, some MCP support
- ****Note:**** Can connect to a Chrome extension for browser-based tasks

Claude Code in Cursor (Recommended for Serious Work)

- ****Cursor**** = A code editor (like Microsoft Word, but for code and projects)
- ****Why Cursor:**** Gives you a visual file explorer – you can see all your folders, create files, navigate projects while Claude is working
- ****Claude's access:**** Full access to all files Claude Code has permission to see
- ****Greg's preference:**** "I prefer the visual connection. I can see all the project folders and watch what Claude is doing."

Gemini in Google AI Pro (Tino's setup)

- Works similarly to Claude Code for skills and MCPs
- Good for people already on Google AI Pro (included with subscription)
- Slightly different interface but same concepts apply

Cursor vs Pure Claude Code

Tino asked: `*"What's the difference between using Sonnet inside Cursor versus Claude Code directly?"*`

Greg's answer: Both are available. The main difference:

- `**Claude Code only**` uses Claude models (Haiku, Sonnet, Opus)
- `**Cursor**` can use Claude models AND other LLMs (GPT, Gemini, etc.)
- Greg's testing found slight output differences but uses pure Anthropic models currently

`## 10. Planning First – The Core Workflow`

`### The Prime Directive`

`> **"For every major task: plan first, execute second."**` – Greg Kowalczyk

This is the single most important operational rule.

`### Why Planning First Matters`

Without a plan:

- You start executing and discover halfway through that you missed something critical
- You waste tokens and time on the wrong approach
- The final output is less aligned with your actual goal

With a plan:

- You see the full scope before committing
- You can catch mistakes before they're built
- The execution is faster and cleaner because every step is defined

`### The Standard Workflow for Any Major Project`

`\ \ \`

- | | |
|---------------------------|--|
| <code>1. BRIEF</code> | <code>→ Give Claude your high-level goal</code> |
| <code>2. QUESTIONS</code> | <code>→ Answer the clarifying questions (be thorough)</code> |
| <code>3. PLAN</code> | <code>→ Review the generated plan as an MD file</code> |
| <code>4. APPROVE</code> | <code>→ Modify if needed, then confirm</code> |
| <code>5. EXECUTE</code> | <code>→ Run the build (often automated / overnight)</code> |
| <code>6. REVIEW</code> | <code>→ Check outputs, give feedback</code> |
| <code>7. ITERATE</code> | <code>→ Refine and improve</code> |

`\ \ \`

`### What Counts as a "Major Task"?`

- Building a website or landing page
- Designing a product launch strategy

- Creating a content calendar
- Researching a new market
- Building a lead generation system
- Any project with 5+ steps

For simple tasks (write one email, answer one question), just ask directly – no plan needed.

11. Interactive HTML Tools (The Playground)

What Is the Playground?

The Playground is Anthropic's tool for building **interactive, self-contained HTML tools** – no designer, no developer, no hosting required.

You describe the tool you want in plain English. Claude builds it as a single HTML file that runs in any browser.

Examples from the Meeting

Tool Description	Business Use
UV burn time calculator (enter skin type + UV index → get safe exposure time)	Embedded on GearTop product pages to drive conversions
Car diagnostic questionnaire (ask questions → identify likely car problem)	Could run on Tino's auto shop website – free tool that drives phone calls
Race registration countdown + sign-up tool	Bronte Harbour Classic race marketing

Why This Matters

Before Claude Code, building an interactive tool meant:

- Hiring a developer (\$2,000–\$10,000+)
- Hiring a designer
- Paying for hosting
- Waiting weeks

With Claude Code:

- Describe it in one sentence
- Claude builds it in minutes
- Works instantly in any browser
- Free to host on GitHub Pages or Vercel

****Business angle:**** Interactive tools dramatically increase time-on-site and conversion rates. A calculator or diagnostic tool is far more

engaging than a static page.

Mathijs's Use Case (from the meeting)

"Can you use this to increase race sign-ups?"

Yes – a tool like "What's your goal time for a 5K? Enter your age, training, and pace → get your predicted finish time + register now" would convert far better than a plain registration page.

12. Real Business Applications

Content Production at Scale

****Traditional approach:****

- Hire copywriter: \$150–\$500 per blog post
- Wait 1–2 weeks per piece
- Manual research each time

****With Claude Code:****

\\\

/seo-content [keyword]

\\\

- Researches the topic live (Perplexity)
- Analyzes top-ranking competitors (Firecrawl)
- Writes the full article (SEO-optimized, human voice)
- Generates 5 social posts from the article (/content-atomizer)
- Creates a newsletter version
- Produces image prompts

Total time: 20–30 minutes for content that would cost \$500–\$1,500 from an agency.

Lead Generation (Greg's GearTop Example)

****Goal:**** Find wholesale hat distributors across the Western US

****What happened:****

1. Playwright + Perplexity searched for distributors in specific regions
2. Firecrawl scraped each company's website
3. Agent compiled 200 contacts with email addresses and company histories
4. Agent wrote personalized outreach emails referencing each company's specific details ("Congratulations on 30 years in business...")
5. Total time: 3 hours

****Traditional approach:**** Weeks of research + a business development hire

SEO & Ranking Intelligence

****What's possible:****

- Daily tracking of your keywords vs. competitors (Hive Rank)
- Automatic identification of content gaps competitors haven't addressed
- AI discoverability audit – are your pages showing up when people ask ChatGPT or Perplexity about your topic?
- Automatic content briefs based on real search data

****The cost comparison:**** SEMrush = \$200+/month. Claude Code + DataForSEO API = fraction of the cost for equivalent or better data.

Self-Learning Skills (Advanced)

Greg described building a skill for an Amazon client that:

1. Runs research on their products and market
2. Takes what it learned
3. Rewrites its own instruction file with the new knowledge
4. Next time it runs, it's smarter

This is a ****self-improving system**** – it gets better with each iteration without manual updates.

****Time savings:**** What took weeks of manual research now runs in hours. Automatically. Every time.

Automated Meeting Documentation

Greg's team has a system that:

- Records every meeting (Google Meet/Zoom)
- Transcribes automatically
- Generates structured notes with decisions, action items, and timestamps
- Saves everything as searchable markdown files

No manual note-taking. Every meeting is permanently documented and searchable.

13. Cost Reality – What This Replaces

Service	Traditional Cost	Claude Code Cost
SEO research (monthly)	\$200–\$500/month (SEMrush/Ahrefs)	\$20–\$50/month
Copywriter (blog posts)	\$150–\$500 per post	Included in subscription

Web developer (site build)	\$5,000–\$15,000	\$0 (Ralph builds it)
Research analyst	\$3,000–\$5,000/month	Automated
Lead generation	\$2,000–\$5,000/month	3 hours of agent time
Graphic designer (social content)	\$50–\$200 per asset	Included
via plugins		
Video creation (Craya, etc.)	\$50–\$200/month	Building in-house
alternative |

****Claude Pro subscription:**** ~\$20/month USD

****Claude Code usage:**** Additional token costs, but typically \$30–\$100/
month for heavy use

****Net savings for a small e-commerce business:**** Easily \$2,000–
\$10,000/month in replaced services.

Patricia's note: *"We're getting rid of Craya once we have our own
image and video tool built."* That's the model – build your own tools
instead of subscribing to others'.

14. Getting Started – Your First Week

Day 1 – Setup

1. ****Create a Claude Pro account**** at claude.ai (\$20/month)
2. ****Download Claude Desktop**** (Greg to share the link)
3. Or: Install ****Cursor**** (free) and connect your Claude account

Day 2 – Your First CLAUDE.md File

Create a text file called `CLAUDE.md` in your project folder. Write:
`\\`

About Me

My name is [Your Name].

I live in [City, Country].

I am working on [describe your project or business].

My Goal for This Project

[What are you trying to accomplish?]

Important Notes

– Always write in [your language]

– When in doubt, ask before proceeding

`\\`

This is your starting knowledge base. It will grow over time.

Day 3 – Try Your First Real Task

Use a simple skill to test the system:

```
\\  
/seo-content [a topic relevant to your work]  
\\
```

Or just ask Claude Code to write something using your CLAUDE.md as context. Watch how it knows who you are and what you need.

Day 4 – Explore Skills

Browse the available skills. Pick 2–3 that match tasks you do repeatedly. Learn the slash commands. Practice using them.

Day 5 – Planning Mode

Take a real project you have in mind. Use the Orchestrator to create a plan. Answer all the questions fully. Review the plan. You don't have to execute yet – just see what's possible.

Day 6–7 – Ask Questions

Greg's offer (from the meeting): Mathijs will set up a shared thread (Tino, Sarah, Mathijs) to share questions and learnings. Use it.

Rule: when you get stuck, ask. Don't waste hours figuring something out that someone else already solved.

15. Quick Reference – Commands & Vocabulary

Vocabulary Cheat Sheet

Term	What It Means
Claude Code	The agentic version of Claude – takes action, manages files
CLAUDE.md	Instruction file that loads automatically; Claude's long-term memory
MCP	Model Context Protocol – connector to external tools (like a USB port)
Plugin	Bundled tool or combination of MCPs with added capability
Skill	Saved, reusable workflow invoked with a `/command`
Orchestrator	Master agent that plans complex projects and coordinates other agents
Agent	An instance of Claude assigned to a specific task
Sub-agent	Agent working under the Orchestrator on a specific piece of a larger project
Token	The unit Claude charges for (roughly 4 characters = 1

token) |
****Markdown / .md****	Plain text file format that computers can read natively
****Plan Mode****	Claude thinks and plans before taking action; shows you the plan for approval
****Cursor****	Code editor used as the visual interface for Claude Code
****Haiku / Sonnet / Opus****	The three Claude model tiers (cheap/mid/expensive)
****Playwright****	Browser automation plugin – Claude controls a browser
****Perplexity****	Real-time web search plugin with cited sources
****Firecrawl****	Website scraping plugin for competitor research
****Hive Rank****	SEO intelligence plugin for ranking tracking

Common Skill Commands

Command	What It Does
<code>`/orchestrator`</code>	Starts project planning with the master coordinator agent
<code>`/newsletter [topic]`</code>	Writes a newsletter on the given topic
<code>`/seo-content [keyword]`</code>	Writes a full SEO-optimized blog post
<code>`/content-atomizer`</code>	Breaks one piece of content into 5+ platform-specific posts
<code>`/keyword-research [topic]`</code>	Researches keywords and search volume for a topic
<code>`/competitor-analysis`</code>	Analyzes competitors in your space
<code>`/positioning-angles`</code>	Finds the best angle for selling a product or service
<code>`/brand-voice`</code>	Defines or extracts your brand voice
<code>`/lead-magnet`</code>	Generates lead magnet concepts for list building
<code>`/ralph-skills:prd`</code>	Creates a full product requirements document
<code>`/frontend-design`</code>	Builds a polished website or UI component

The Golden Rules

1. ****Plan first, execute second**** – always enter Plan Mode for major tasks
2. ****Answer all questions**** – the more context you give, the better the output
3. ****Use Opus to plan, Sonnet to execute**** – save money without losing quality
4. ****Build your CLAUDE.md incrementally**** – add to it every time Claude gets something wrong
5. ****Use skills instead of explaining**** – if you're explaining the same thing twice, make a skill
6. ****Watch it work**** – open your file explorer, watch files being created in real time
7. ****Iterate fast**** – don't wait for perfect, ship and improve

Appendix – Greg's Current Stack (Feb 2026)

****Plugins active:**** 40-50+ including Perplexity, Playwright, Firecrawl, Google Workspace, Glif (image gen), Replicate, Hive Rank

****Key skills in use:**** Orchestrator, newsletter, seo-content, content-atomizer, keyword-research, competitor-analysis, positioning-angles, brand-voice, lead-magnet, frontend-design, ralph (autonomous builder), and many more

****Platforms:**** Claude Code via Cursor (primary), Claude Desktop, N8N for workflow automation, Lindy for no-code automation, GitHub for version control, Vercel for hosting

****Cost benchmark:**** Complete 15-page SEO-optimized website for D.JANC WORKSHOP – built in one evening by Ralph (autonomous Claude agent). Total build cost: ~\$5-10 in tokens. Traditional cost: \$5,000-\$15,000.

This manual was prepared from the Feb 21, 2026 group session hosted by Greg Kowalczyk. For questions, updates, or to share what you've learned, post in the group thread Mathijs is creating.

Version 1.0 – Feb 2026
